

# Order Tracking & Management for Tank Farms, Terminals & Refineries

*Utilize a flexible order system with built-in event work flows, such as automated BOL printing, that simplify owner, operator, driver, and customer operations*

## Improve Your Service Levels

*FuelsManager Oil & Gas Terminal Automation Edition provides an order system for your operators and supply chain partners that is simple, secure, and efficient to use. It can be operated as a stand-alone system or integrated with external order systems.*

### Event Based Work Flows Streamline Operations

The browser-based user interface allows orders to be entered on site by your terminal operators or over the Internet by your customers. The system sends e-mail notifications to the appropriate individuals to initiate the required action, such as approving an order. It is able to automatically update order status at any point in the work flow, such as at order confirmation, during the loading process or at final delivery. Real-time integration of information provides:

- Reduced costs associated with phone or e-mail support by allowing your customers to check order information or status themselves
- Increased truck throughput by reducing the amount of data drivers are required to enter into driver entry terminals or presets

### Secure System Access & Control

You control access to information at the individual user level. For example, your terminal operators are able to view a master summary for all customers while your customers are provided the same intuitive interface but are restricted to viewing only their own order summary.

### Easily Integrated Into Existing Enterprise Systems

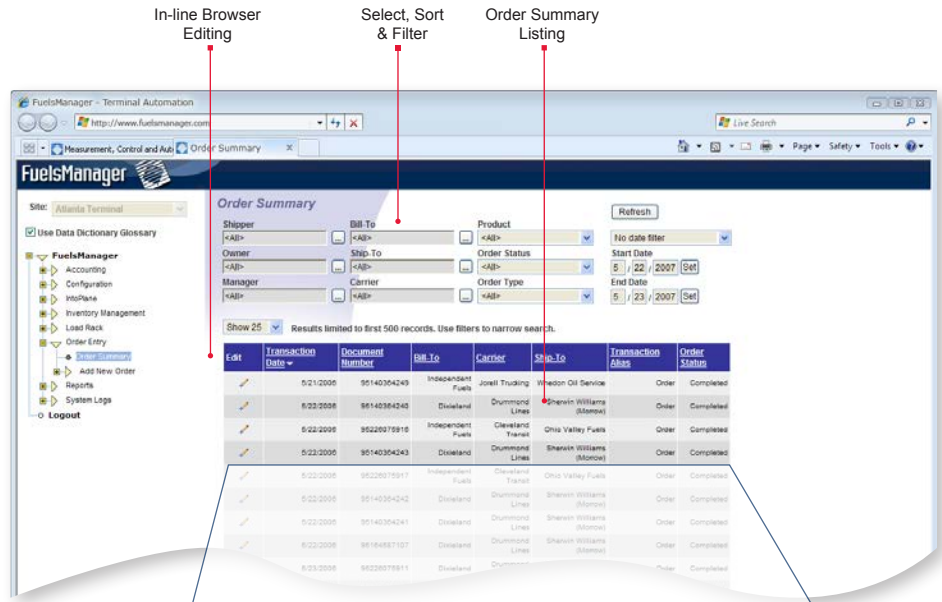

Varec can provide custom engineering services to develop automatic interfaces to populate orders from your corporate ERP or other management systems. When integrated with corporate order systems, such as SAP, your system is able to automatically receive order information and transmit BOL data.

# Order Tracking & Management

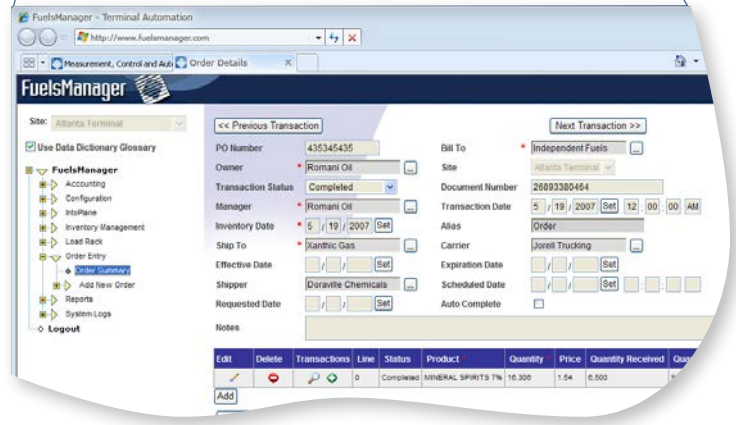

for Tank Farms, Terminals & Refineries

An Intuitive easy-to-use interface allows managing and tracking of all orders in the system.

- ▶ Filter orders by selecting company, product, order status, order type, or a date range and display relevant transactions in an easy-to-read table.
- ▶ Drill down into the details of an order to view or edit in real time.
- ▶ Permissions based security guarantees secure management of all orders.
